

EXHIBIT A

Despite the lack of block-level population data being available, utilizing voting precinct level populations that were acquired from the state's redistricting data, the existing County Commissioner Precincts (Pct) could be analyzed (*see Exhibit B for population details at the VTD-level*). The following is the result of that analysis.

Summary Analysis
2020 Census Results - Existing Commissioner Precincts

Com1	Com2	Com3	Com4	Total Pop
67,126	70,809 (largest)	69,807	59,372 (smallest)	267,114
**				Deviation: 19.263%

**Maximum deviation: less than 10% between largest/smallest
Redistricting is REQUIRED.

Redistricting Goals	
"Ideal" Population: (267,114 / 4 pcts) =	66,778 each (rounded down)

Example (using a deviation of 4.7% of "ideal" population)

Minimum/Maximum Pop Deviation:	3138.566
	Rounded 3,138

Therefore:

If the Largest Pct. Pop. equals:	69,916
Then, Smallest Pct. Pop. cannot be less than:	63,640
Sample Deviation = ((69916/63640)-1)%	9.9%

Notes:

Various population scenarios can be entertained provided that the deviation between the largest and smallest precincts remains 10% or less.

The last two decennial censuses have resulted in Precincts 2 and 3 having the greatest population increases and Precinct 4 with the least. As a result, it may be advisable to attempt to keep Precincts 2 and 3 at or below the ideal population so that future potential impacts can be minimized.
